#### **Introduction:**

Uterine anomalies are relatively common entities. The most common of which are uterine septae which are often associated with infertility, pregnancy loss, and other obstetric complications and poor outcomes.

#### **Discussion:**

This case depicts a novel approach to take down of a complete uterine septum with two cervixes. This approach utilizes a plastic needle guide juxtaposed against hysteroscopic scissors to aid in stabilization of the septum during excision facilitating safe take down. With this technique, the plastic needle guide is placed through one cervix while the hysteroscope is placed through the other cervix
